

Streamlining Sheetmetal Fabrication With Techniques and Processes

Our Product Introduction

Basic Information

- Place of Origin: China Shenzhen
- Brand Name: Aluminum,Copper,Brass,Steel,Stainless Steel
- Certification: SheetMetal Fabrication
- Model Number: Polishing,Anodizing,Painting,Chrome Plating, Silkscreen
- Minimum Order Quantity: 1 piece
- Price: USD 30 piece
- Packaging Details: Carton, Plywood Box
- Delivery Time: 3 - 5 Days
- Payment Terms: T/T, Paypal
- Supply Ability: 1 piece per day

Product Specification

- Material: Metal
- Lead Time: 2-4 Weeks
- Size: Customized
- Thickness: 0.5mm-10mm
- Application: Industrial
- Process: Cutting, Bending, Welding
- Surface Treatment: Powder Coating
- Type: SheetMetal Fabrication
- Highlight: **streamlining sheetmetal fabrication, streamlining sheet metal prototype, 10mm sheetmetal fabrication**

Product Description

Introduction of Sheet Metal Fabrication

Sheet metal fabrication is a manufacturing process that involves shaping and forming sheet metal into desired parts and components. It encompasses various techniques and processes to cut, bend, punch, weld, and assemble sheet metal to create a final product. Sheet metal fabrication is commonly used in industries such as automotive, aerospace, construction, electronics, and more. Here are some key aspects and processes involved in sheet metal fabrication:

Material Selection: Sheet metal can be made from a variety of materials, including steel, aluminum, stainless steel, copper, brass, and more. The choice of material depends on factors such as desired strength, corrosion resistance, weight, cost, and specific application requirements.

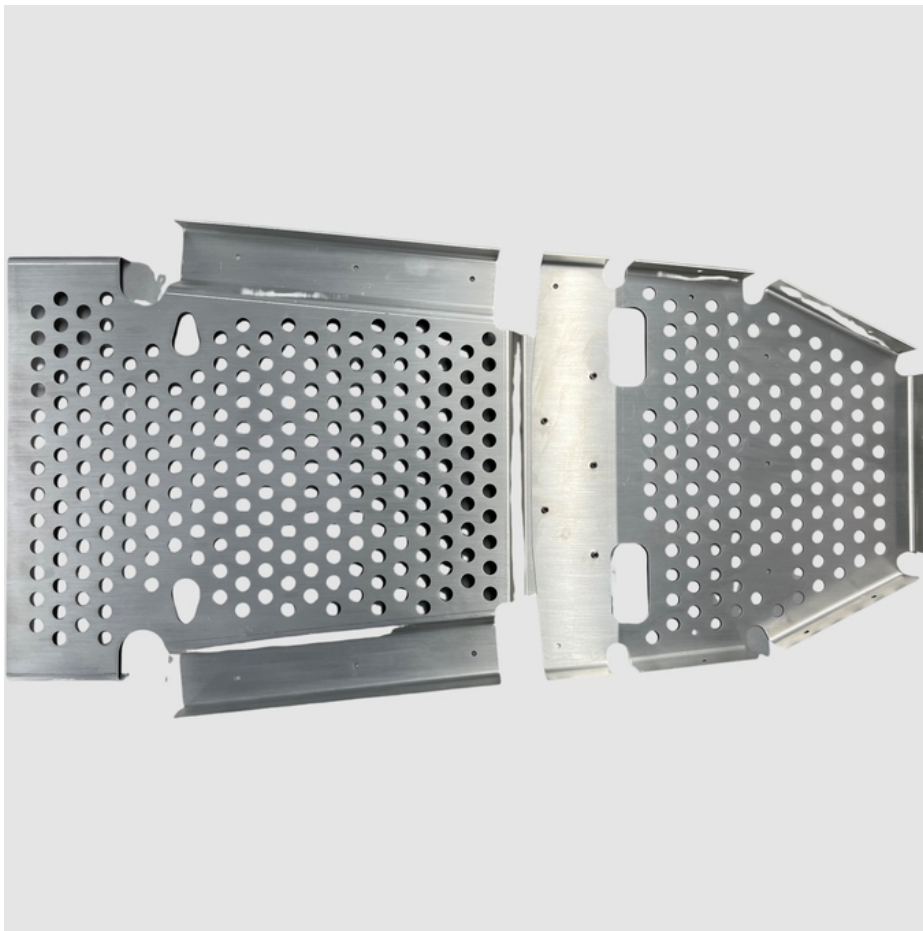

Cutting and Shearing: Sheet metal is typically cut into the desired shape and size using various methods. Common cutting techniques include laser cutting, plasma cutting, waterjet cutting, and mechanical shearing. These methods provide precise and clean cuts, ensuring accurate dimensions for subsequent forming processes.

Forming and Bending: Forming and bending are crucial processes in sheet metal fabrication to create three-dimensional shapes from flat sheets. Press brakes are commonly used to bend and shape the metal, allowing for the creation of angles, curves, flanges, and other structural features. Roll forming and stamping processes may also be employed for specific applications.

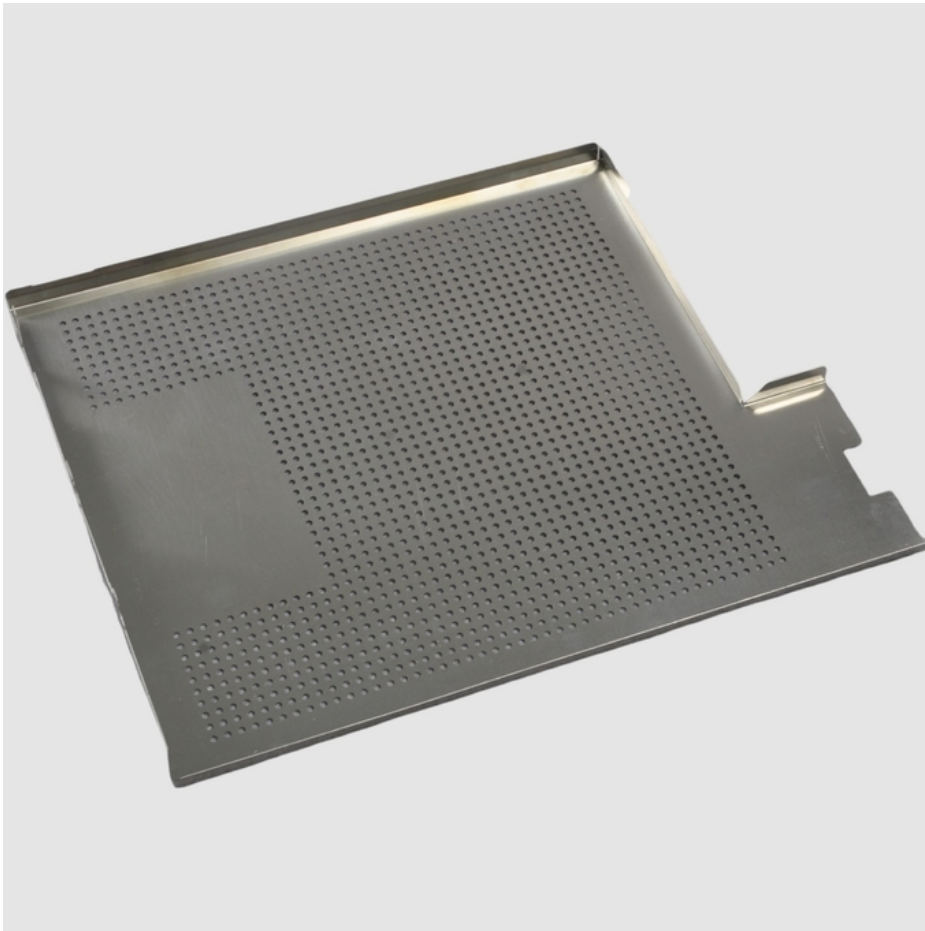

Punching and Perforating: Punching involves creating holes, slots, or other patterns in the sheet metal. Punching machines use specialized tooling to cut through the material, enabling the incorporation of fasteners, ventilation, or aesthetic features. Perforating is a similar process that creates a pattern of regularly spaced holes in the sheet metal for specific functional or decorative purposes.

Welding and Joining: Welding is employed to join multiple sheet metal components together to create a larger assembly or structure. Common welding techniques used in sheet metal fabrication include MIG (Metal Inert Gas) welding, TIG (Tungsten Inert Gas) welding, and spot welding. These methods ensure strong and durable connections between the metal parts.

Sheet Metal Fabrication Standards		
To ensure part maneuverability and precision of fabricated prototypes and parts, our custom sheet metal fabrication services are in compliance with the ISO 2768-m.		
Dimension Detail	Metric Units	Imperial Units
Edge to edge, single surface	±0.127 mm	± 0.005 in.
Edge to hole, single surface	±0.127 mm	± 0.005 in.
Hole to hole, single surface	±0.127 mm	± 0.005 in.
Bend to edge / hole, single surface	±0.254 mm	± 0.010 in.
Edge to feature, multiple surface	±0.762 mm	± 0.010 in.
Over formed part, multiple surface	±0.762 mm	± 0.030 in.
Bend angle	± 1°	
By default, sharp edges will be broken and deburred. For any critical edges that must be left sharp, please note and specify them in your drawing.		

Finishing and Surface Treatment: After the fabrication processes, sheet metal parts may undergo finishing treatments to improve their appearance and enhance their performance. Surface treatments can include cleaning, deburring, grinding, polishing, painting, powder coating, or applying protective coatings to increase resistance to corrosion or wear.

Assembly and Integration: Sheet metal components are often assembled and integrated with other parts to create a final product or system. This may involve fastening with screws, rivets, or adhesives, as well as incorporating additional components such as hinges, handles, brackets, or electrical connectors.

Sheet metal fabrication offers several advantages, including high strength-to-weight ratio, versatility in design, cost-effectiveness for large-scale production, and suitability for both functional and decorative applications. It enables the creation of a wide range of products, from simple brackets and enclosures to complex structural components and machinery.
