

## EV Charging Infrastructure Cnc Machining Rapid Prototyping Silkscreen Painting Surface Finish

### Our Product Introduction

for more products please visit us on [cncmachining-prototype.com](http://cncmachining-prototype.com)

#### Basic Information

- Place of Origin: China Shenzhen
- Brand Name: EV Charging Infrastructure Prototype
- Certification: Polishing, Anodizing, Painting, Chrome Plating, Silkscreen
- Model Number: ABS, PC, PMMA, POM, PA, PTFE, PEEK
- Minimum Order Quantity: 1 piece
- Price: USD 30 piece
- Packaging Details: Carton, Plywood Box
- Delivery Time: 3 - 5 Days
- Payment Terms: T/T, Paypal
- Supply Ability: 1 piece per day

#### Product Specification

- Model: Prototype
- Surface Finish: Polishing, Anodizing, Painting, Chrome Plating, Silkscreen
- Payment Options: T/T, Paypal
- File Format: Step, Igs, X\_T, Sldprt
- Material: ABS, PC, PMMA, PTFE, PVDF, Aluminum, Copp
- Production Method: CNC Machining, Vacuum Casting, Sheet Metal Fabrication
- Type: EV Charging Infrastructure Prototype
- Highlight: **cnc machining rapid prototyping silkscreen, silkscreen rapid prototyping cnc machining, painting cnc machining rapid prototyping**

## Product Description

### EV Charging Infrastructure Prototype: Powering the Future with Barana Rapid CNC Manufacturing

Welcome to Barana Rapid CNC Manufacturing, where we are at the forefront of supporting the electric vehicle (EV) revolution with our advanced prototyping services for EV charging infrastructure. Our expertise and state-of-the-art technology equip us to deliver high-quality prototypes that drive innovation and practicality in the burgeoning EV market.

### Manufacturing Principle: High Precision for High Performance

Barana is grounded in precision engineering, employing state-of-the-art CNC technology to fabricate components for EV charging stations with unparalleled precision. Our production begins with your intricate designs, which are carefully converted into tangible components using our sophisticated CNC machinery. This advanced technology enables swift creation of prototypes featuring intricate geometries and stringent tolerances, crucial for the dependable functionality of EV charging stations.

### Advantages of Partnering with Barana:

**Rapid Development:** In the swiftly evolving EV market, speed is of the essence. Our CNC technology facilitates a swift transition from design to prototype, shortening development cycles and accelerating market entry.

**Scalability:** Our processes are tailored to scale efficiently, catering to your needs from a single prototype for testing to a series for pilot deployment.

**Material Versatility:** We utilize a diverse array of materials, encompassing metals and advanced polymers, to guarantee durability and adherence to environmental standards for outdoor applications.

**Integrated Solutions:** We extend our services beyond prototyping to include design optimization, small-scale production, and post-processing, offering an all-encompassing solution from the initial concept to the completed prototype.

#### Capabilities That Drive Innovation

Barana's capabilities extend well beyond traditional prototyping:

**Customization:** Tailored components that fit specific requirements for various types of EV charging stations, including Level 1, Level 2, and DC fast charging.

**Precision Machining:** High-precision machining capabilities that meet the stringent requirements of the EV industry.

**Electrical Component Integration:** Assembly and integration of electrical systems, ensuring that prototypes are fully functional for real-world testing.

**Quality Assurance:** Rigorous testing and quality control measures to guarantee that each prototype meets global standards and performs flawlessly in all conditions.

Plastic	Acrylonitrile butadiene styrene	ABS
Plastic	Acrylonitrile butadiene styrene	ABS Hight Temp
Plastic	Acrylonitrile butadiene styrene	ABS Anti Static
Plastic	Acrylonitrile butadiene styrene + Polycarbonate	ABS + PC
Plastic	High-density polyethylene	HDPE, PEHD
Plastic	Nylon 6	PA6
Plastic	Nylon 6 + 30% Glass Fill	PA6 + 30% GF
Plastic	Nylon 6-6 + 30% Glass Fill	PA66 + 30% GF
Plastic	Nylon 6-6 Polyamide	PA66
Plastic	Polybutylene terephthalate	PBT
Plastic	Polycarbonate	PC
Plastic	Polycarbonate – Glass fill	PC + GF
Plastic	Polycarbonate + 30% Glass fill	PC + 30% GF
Plastic	Polyethere-ther-ketone	PEEK
Plastic	Poly-ethe-rimide	PEI
Plastic	Polyethylene	PE
Plastic	Polyethylene terephthalate	PET
Plastic	Polymethyl methacrylate – acrylic	PMMA Acrylic
Plastic	Polyoxybenzylmethyleneglycolanhydride	Bakelite
Plastic	Polyoxymethylene	POM
Plastic	Polyphenylene sulfide	PPS
Plastic	Polyphenylene sulfide + Glass Fill	PPS + GF
Plastic	Polypropylene	PP
Plastic	Polytetrafluoroethylene	PTFE
Plastic	Polyvinylidene fluoride	PVDF

#### Service Quality: Excellence at Every Step

Barana is committed to the highest standards of service quality. Our ISO 9001 certification is a testament to our dedication to maintaining superior quality management systems and ensuring customer satisfaction. Our team consists of skilled engineers and technicians who specialize in rapid prototyping and are committed to providing exceptional, personalized service to each

client.

Our company offers a comprehensive range of professional finishing services to enhance the appearance, performance, and durability of parts. Here are the major finishing services we provide:

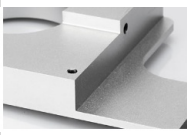

**Anodizing:** Anodizing is an electrochemical process primarily used for aluminum parts. It creates a protective oxide layer on the surface, improving corrosion resistance and providing a decorative finish. Anodizing can also be combined with dyeing to add color options.

**Painting:** Our painting services allow for the application of various paint types to achieve desired colors, textures, or protective layers. Spray painting and powder coating are commonly used methods to enhance the appearance and surface qualities of parts.

**Pad and Silk Screen Printing:** Pad and silk screen printing techniques are employed to apply custom designs, logos, or labels onto parts. This service facilitates branding, product identification, or the addition of instructional information to enhance the visual appeal.

**Sanding and Polishing:** Our sanding and polishing services utilize abrasive materials to remove roughness and imperfections from surfaces, resulting in a smoother and more refined finish. This process enhances the appearance and feel of the parts.

Our Surface Finishing Specifications					
Part surface finishing techniques can improve the aesthetics and function of your parts. Each surface treatment process has requirements, such as material, color, texture, and price. Below are the specifications of the surface treatment technologies offered by Barana Rapid					
Pic	Name	Description	Materials	Color	Texture
	Anodizing	Anodizing improves corrosion resistance, enhancing wear resistance and hardness, and protecting the metal surface. Widely used in mechanical parts, aircraft, and automobile parts, precision instruments, etc.	Aluminum	Clear, black, grey, red, blue, gold	Smooth, matte finish
	As Machined	Sand blasting results in parts with a smooth surface with a matte texture. Used mainly for visual applications and can be followed by other surface treatments.	All materials	N/A	Stain

	Sand Blasting	Sand blasting results in parts with a smooth surface with a matte texture. Used mainly for visual applications and can be followed by other surface treatments.	Aluminum, Brass, Copper	N/A	Matte
	Powder Coating	Powder coating is a type of coating that is applied as a free-flowing, dry powder. Unlike conventional liquid paint which is delivered via an evaporating solvent, powder coating is typically applied electrostatically and then cured under heat or with ultraviolet light.	All metal materials	Custom	Gloss or semi-gloss
	Electroplating	Electroplating can be functional, decorative or corrosion-related. Many industries use the process, including the automotive sector, in which chrome-plating of steel automobile parts is common.	Aluminum, steel, Stainless Steel	Gold, silver, nickel, copper, brass	Smooth, Glossy finish
	Polishing	Polishing is the process of creating a smooth and shiny surface, either through physical rubbing of the part or by chemical interference. The process produces a surface with significant specular reflection, but in some materials is able to reduce diffuse reflection.	All materials	Smooth, glossy finish	Glossy
	Brushing	Brushing is a surface treatment process in which abrasive belts are used to draw traces on the surface of a material, usually for aesthetic purposes.	ABS, Aluminum, Brass, Stainless Steel, Steel	N/A	Satin
	Painting	Painting involves spraying a layer of paint onto the surface of the part. Colors can be matched to a Pantone color number of the customer's choosing, while finishes range from matte to gloss to metallic	Aluminum, Stainless Steel, Steel	Custom	Gloss, semi-gloss, flat, metallic, textured
	Black Anodized	coating is similar to Alodine that is used for steel and stainless steel. It is used mainly for appearance and for mild corrosion resistance.	Steel, Stainless Steel	Black	Smooth, matte
	Alodine	Chromate conversion coating, more commonly known by its brand name Alodine, is a chemical coating that passivates and protects aluminum from corrosion. It is also used as a base layer before priming and painting parts.	Aluminum	Clear, Gold	Same as before
	Laser Carving	laser carving is a cost-effective way to add logos or custom lettering to your designs and is often used for custom part tagging during full-scale production.	All materials	Custom	N/A

**Vapor Polishing:** Vapor polishing is a technique used for plastic parts. It employs solvents or chemicals to melt the surface, eliminating imperfections and creating a glossy, transparent finish. Vapor polishing enhances the overall quality and visual appeal of plastic components.

**Powder Coating:** Powder coating is a dry finishing process where a fine powder is electrostatically applied to the surface of the part. The coated part is then heated, allowing the powder to melt and form a durable and protective layer. Powder coating provides excellent resistance to corrosion, chemicals, and UV rays.

**Blasting:** Blasting involves directing high-velocity particles or beads onto the surface of parts. This process effectively removes imperfections, burrs, and sharp edges, resulting in a more uniform and matte finish. Blasting improves the overall surface quality and prepares the parts for subsequent treatments or applications.

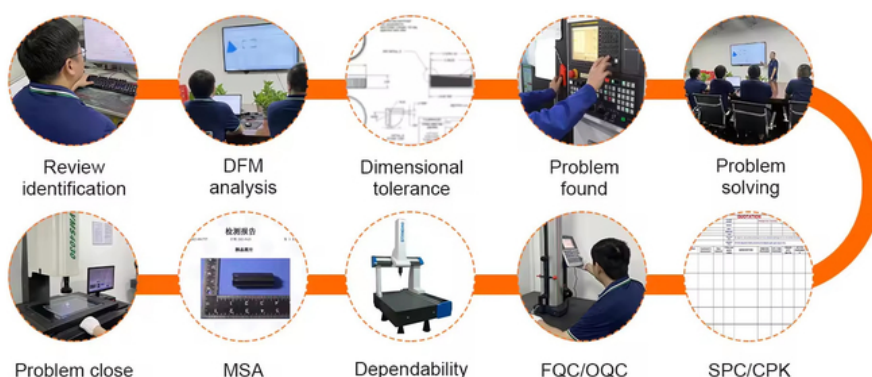

By utilizing our full suite of finishing services, you can ensure that your parts not only meet functional specifications but also have an enhanced appearance, improved performance, and increased durability. Our skilled team will work with you to

determine the most suitable finishing techniques for your specific requirements.

Our First Article Inspection Process				
When Barana Rapid receives your order requirements, we will carry out the first article inspection service. According to our company's regulations, Barana Rapid will provide the first article inspection service to ensure better completion of your machining project if the order demand reaches 3,000 US dollars or the minimum order quantity is 300 pieces.				
	Step 1	Step 2	Step 3	Step 4
Barana Rapid	Offer first article inspection We offer first article inspection services for batch production.	Draft contract We review the project and contact customers for detailed information.	Produce sample We produce sample parts according to the FAI agreement and deliver them to you.	Full-scale production The full-scale production starts and finishes production within lead time.
Client	Request inspection You request first article inspection for a project that meets our FAI requirements.	Sign contract You sign the FAI agreement provided by us and agree on our Terms and Conditions.	Receive sample You receive and examine the parts, inform us of full-scale production may begin.	Receive products You receive your prototypes or production parts on the required lead time.
